

Courier 4000 SEP Module

Product Overview

ExoTerra's Courier 4000 Solar Electric Propulsion Module delivers up to 9.4 km/s to a 150 kg Payload. The revolutionary system enables delivery of 175 kg microsattellites to GEO from a small launch vehicle delivery to LEO. It's optional bus module supports interplanetary missions throughout the inner solar system.

Courier begins with ExoTerra's Halo12 Hall Effect Thruster. Halo operates between 250-1000W and can process >250 kg of propellant for high impulse missions.

Courier XL is powered by ExoTerra's high specific power Fold Out Solar Arrays (FOSA). The arrays provide up to 1500 W of power to payloads during operations.

Courier XL Provides >11000 m/s ΔV and fits within Small Launch Vehicles

Small Launch Vehicle Upper Stage

ExoTerra's high impulse Solar Electric Propulsion Module, Courier 4000, enables microsattelite transfer from LEO to GEO, Cislunar and Interplanetary destinations. With Courier 4000, microsattellites can now reach distant destinations from a dedicated small launch vehicle. Courier's 6000-11,000+ m/s ΔV offers the ability to optimize the mission orbit by adjusting inclination or raise orbit altitude after a drop-off, reduces life cycle cost by extending mission lifetime, enables end of life deorbiting, or performs large orbit insertions. In addition, the module's high specific power solar arrays can deliver up to 1500W of power to the payload when the thruster is not in use, expanding payload performance options and increasing telecommunications potential. Designed for interplanetary missions, the 100 kRad electronics offer extended mission lifetime and reliability to any mission.

A bus module can be added to the system to transform the stage into a full bus for GEO or interplanetary missions. The bus module adds improved telecommunications, pointing and processing capability. Contact ExoTerra for details.

Customer Interface: 24" Lightband

Customer Mass: Up to 200 kg

Customer Power: up to 1.5 kW

Propellant Capacity: 225 kg
 ΔV : 6-11 km/s

Thrust Range: 96-138 mN

Radiation Tol: 100 kRad

Propellant: Xenon or Krypton

ESPA Payload Volume

200 kg Payload Capacity

1500 W Payload Power

100 kRad Electronics

96-138 mN Thrust
6-11 km/s ΔV

Courier 4000 Expands Small Launch Vehicle's Reach to GEO, Cis-Lunar and Beyond

About ExoTerra

ExoTerra was founded in 2011 with a vision of reducing the cost of space exploration. We pursue this goal by developing affordable technologies that reduce the cost of gravity by minimizing spacecraft mass through electric propulsion, miniaturization of components, and in-situ resource utilization.

Bus and Module Options

The standard Courier 4000 system is designed to fit with a Virgin Orbit LauncherOne. ExoTerra has variations that can fit within standard rideshare volumes or alternative small Launch Vehicles. ExoTerra also offers stand-alone SEP and propulsion modules that can be attached to customer supplied spacecraft. Please inquire about details.

Courier 4000 Development Status

ExoTerra's Solar Electric Propulsion Components have completed flight qualification testing. A prototype Courier 4000 is being built and tested under the NASA SBIR program with support of Virgin Orbit.
